Results of Audit: CCMUA meets NBP Expectations and Requirements

DEKRA Certification, Inc. conducted an independent third party audit of the environmental management system used by the Camden County Municipal Utility Authority (CCMUA) in managing its biosolids program.

The results of the audit determined that: Use of a management system approach is generating positive outcomes for CCMUA’s biosolids program in the areas of regulatory compliance, environmental performance, quality practices and relations with interested parties.

CCMUA biosolids practices are consistent with NBP expectations and meet requirements of the NBP BMP Elements, with minor exceptions.

All nonconformances from prior DEKRA audits have been effectively corrected.

February 1-5, 2016 has verified that the CCMUA biosolids management program meets NBP expectations and requirements and we recommend Recertification within NBP Biosolids Management Program.

During this audit, DEKRA noted the following strengths in the CCMUA biosolids management system. Leadership by CCMUA in the Camden Collaborative Initiative is an excellent example of proactive outreach and public participation.

CCMUA has prepared corrective action plans for the six nonconformity identified and those plans have been approved by the Lead Auditor.

The audit was consistent with NBP requirements for Reverification Audits and the Scope of Work agreed by CCMUA and DEKRA. It was conducted as an integrated audit covering requirements of ISO-14001:2004 and the NBP BMP Elements (July 2011), with special attention to practices and management activities that directly support biosolids-related operations, processes and activities.
Be a good neighbor to the surrounding community with a view to not only doing no harm, with respect to odor impacts, but also to undertake initiatives to improve the quality of life for our neighbors.

Progress Towards Goals and Objectives

Camden County MUA continues to optimize achievement of its four main long term goals to help continually improve performance of its Environmental Management System. These goals are to:

1. Optimize water quality performance,
2. Optimize air quality/odor control performance
3. Minimize cost to ratepayers and
4. Improve community relationship

In addition, the CCMUA has a number of objectives which contribute to, and fall under, the overarching umbrella of these main goals. Most of the objectives established for year 2016 were completed and completed on time. Accomplishments include:

- Maintained Effluent TSS <5 PPM
- Maintained Effluent CBOD <5 PPM
- "0" Air Permit violations per year
- Conducted one inspection of biosolids hauling destinations (i.e. landfill, land application sites) per year
- Reduced energy use from distribution grid by 10% by using solar power and proceeded with the construction of the sludge digester.
- Update SOPs to reflect EMS requirements.
- Started constructed of nine new green infrastructure projects during 2016.
- Maintained R&R requirements of $3.5 million/year or less.

2017 Objectives

Each year CCMUA establishes objectives to help achieve its main goals and continually improve its Environmental Management System:

- Use of Green Energy.
- Processing Ratio of Sludge.
- EMS System Certification.
- CSO Long Term Control Plan.

- Optimize Effluent TSS
- Optimize Effluent CBOD
- Minimize adverse impact from odor.
- Conduct at least one inspection of biosolids hauling destinations
- Update SOPs as needed to reflect EMS requirements
- Reduce energy by using solar power.
- Complete the construction of nine new green infrastructure projects.
CCMUA’s Environmental Management System complies with all applicable federal, state, and local requirements.

The Authorities effluent concentrations of TSS and CBOD are averaging below 5 mg/l, which is significantly lower than the discharge permit requirements of 30 mg/l and 25 mg/l, respectively. Zero non-compliances occurred in the past year. The effluent quality has remained at optimal levels, nearly drinking water levels throughout the year.

Biosolids produced at CCMUA met all standards required by U.S. EPA for metal concentrations.

The treatment plant’s outstanding performance captures approximately 60,000 tons of biosolids per year that otherwise would go into the Delaware River.

The Authority has received approval from the Local Finance Board for the contract between the Authority and the selected vendor, Anaergia to operate an Anaerobic Sludge Digester. An application for funding the digester has been made to the NJEIT. Construction of the digester is expected to begin in 2017.

The primary objectives of the Sludge Digestion System at the CCMUA are to:

- Improve the performance of the sludge drier facility.
- Reduce overall operating costs including electricity, sludge disposal, associated maintenance and chemical costs.
- Advance Camden County’s Sustainability program through the generation of renewable energy and reduction in green house gas emissions.

One of the main priorities for CCMUA is to minimize adverse impact from odors emanating from the wastewater treatment and sludge disposal process. This is being done both through implementation of a “zero tolerance” policy for odors, and through capital improvements. The CCMUA has also been pursuing this goal through implementation of successful odor control strategies, such as assigning additional supervisors, operators and maintenance staff on weekends, produce sludge cake with solids concentration of at least 27% to reduce the amount of sludge to be hauled out from plant, and minimization of off-site sludge hauling during off hours. In addition, suspended solids levels in the effluent have been reduced 35 percent from 9.3 parts per million parts per “0” air permit violations.
During 2016, the Authority met its goals for Environmental Justice and Green Infrastructure through the Camden Smart Initiative.

Camden SMART is a collaboration between the City of Camden, Camden County Municipal Utilities Authority, Cooper’s Ferry Partnership, Rutgers Cooperative Extension Water Resources Program, New Jersey Tree Foundation, NJ Department of Environmental Protection. The purpose of Camden SMART is to develop and implement a comprehensive network of green infrastructure programs and storm water management in the City of Camden.

As a founding member of Camden SMART, the Authority has received funding from the New Jersey Environmental Trust (NJEIT) to build a series of new green infrastructure projects. These projects are expected to prevent 3.7 million gallons of stormwater from flooding neighborhoods each year. Below is a list of the projects built during 2016, which brings the total number of projects completed to 56:

Environmental Infrastructure Trust Projects Completed

A series of 56 Camden SMART stormwater management projects have been installed in Camden City. Funded by the New Jersey Environmental Infrastructure Trust, these manage 63 million gallons of stormwater each year. Below is a description of these projects:

Von Nieda Park Stormwater Management

The Von Nieda Park Stormwater Management Project has installed new reinforced concrete storm sewer pipes, added a stormwater detention basin, reconstructed baseball fields, and has added two new storm water depressions to the park. Flow from the park now will be conveyed into the Baldwin’s Run daylighted stream and out to the back channel of the Delaware River.

Baldwin’s Run Urban Daylighting Project

The Baldwin’s Run Urban Daylighting Project has reconstructed an historic streambed that used to run through Von Nieda Park. The newly constructed streambed is now an active waterway that conveys water from Von Nieda Park out into the backchannel of the Delaware River. The project included wetlands creation, a boardwalk path and a multi-use trail. The project is located between Harrison Ave and the backchannel of the Delaware River northwest of Von Nieda Park.

Phoenix Park Project

Phoenix Park has transformed a five acre brownfield site into a new waterfront park that manages over five million gallons of stormwater each year. The park’s green space bridges a decades-old gap between a distressed urban residential neighborhood and the Delaware River, offering views of the skyline of Philadelphia from the heart of Camden’s industrial waterfront. The park creates an opportunity for residents of the Waterfront South neighborhood to experience a park setting on their waterfront, amidst the surrounding heavy industry. Phoenix Park includes a gravel walking path with trees, native wildflower meadows and turf grass. The site is connected to the Michael Doyle Fishing Pier with a walkway along the Delaware River. These are located just south of the Camden County Municipal Utilities Authority plant in the Waterfront South neighborhood.

Green Infrastructure Projects

Smaller Green Infrastructure Projects are scattered throughout Camden. Projects include the installation of rain gardens, porous pavement, rainwater harvesting cisterns, stormwater planters and various tree and shrub plantings. The combined sites manage millions of gallons of stormwater each year helping to reduce stormwater flooding.

Sewer Rehabilitation Project

This project has rehabilitation/reconstructed structurally and hydraulically deficient sewers, ranging from 12’ – 72” in diameter, at eight locations within the City of Camden. The project includes replacement of sewers, installation/replacement of manholes/inlets and other related structures, reconnection of sewer laterals, jetting/vacuuming of adjacent existing sewers, and street/sidewalk restoration.
Sludge Drying Facility

During 2016, the Drying Facility was safely operated, with zero recordable injuries, and complete environmental compliance was maintained. Uncontrollable circumstances led to one dryer being out of service during part of the year.

At full capacity the three dryers can process an average of 160 tons of sludge per day. During many months, all three dryers were operational. At least two dryers are needed to be able to process most of the sludge produced by the facility. As of the date of this report, all three dryers are operational.

The dryers have the ability to reduce sludge disposal costs, by up to 50%. These dryers also reduce odors as a result of the reduction in truck traffic. This reduction in odors helps to improve the quality of life for the surrounding neighborhood.
